

[Anxiety Depression And Mood Scale Adams Pdf](#)

Study	Sample size	Methods	Major findings
Gupta et al, 2005 <sup>15</sup>	Over 13.9 million patients	- ICD-9-CM codes	94,521 (0.68%) rosacea patients also had a diagnosis of a depressive disease, which constitutes ~70% of all psychiatric comorbidities among rosacea patients. This was much higher than the 29.9% prevalence of depression among all psychiatric patient visits.
Abram et al, 2009 <sup>18</sup>	70 patients attending a dermatologist (seekers) and 56 with rosacea selected randomly from the population (non-seekers)	- VAS assessing how disturbing rosacea was during the past 4 weeks - Estonian Mood Scale questionnaire	Seekers presented significantly higher VAS scores (6.2±3.1) compared with non-seekers (3.1±2.7) ( $p<0.001$ ). Higher mean VAS scores were associated with the presence of depressive symptoms, but not with the disease severity. Health care-seeking behavior was associated with higher subjective disease perception.
Bewley et al, 2016 <sup>21</sup>	5 randomized controlled trials 1 open-label safety study 1 epidemiological study	- DLQI - EQ5D - FRQ - PSLQ	Regarding EQ5D index, domains of pain/discomfort (31.5% moderate or extreme pain) and anxiety/depression (26.4% moderate or extreme) were mostly affected. Almost half (43%) of the subjects had at least moderately impaired HRQoL, including 19.8% with a DLQI total score of $\geq 10$ points indicating severely impaired HRQoL. Among subjects self-assessing their rosacea as severe, almost two-thirds (62%) reported that their erythema of rosacea at least somewhat interfered with their social life and almost half (47.8%) with their work life. Erythema of rosacea causes a marked decrease of HRQoL in most patients, especially those with self-perceived severe erythema and without inflammatory lesions.
Spoendlin et al, 2014 <sup>19</sup>	Case-control study among 53,927 rosacea patients	UK-based General Practice Research Database	Depression or other affective disorders were not associated with incident rosacea, whereas patients with schizophrenia were at a decreased risk of rosacea. A decreased risk of rosacea among people with chronic lithium exposure was observed.
Moustafa et al, 2014 <sup>24</sup>	17 studies	A search of the MEDLINE, EMBASE and psychINFO databases	Patients with rosacea have higher incidences of embarrassment, social anxiety, depression and decreased quality of life compared with the rest of the population.
Su and Drummond, 2012 <sup>17</sup>	31 patients	- Blushing Propensity Scale, - the Fear of Negative Evaluation Questionnaire - the Phobia Scale - Depression Anxiety and Stress Scale - the Social Interaction Anxiety Scale - the Social Phobia Scale	Blushing propensity scores were elevated in people with severe rosacea. Fear of blushing may contribute to social anxiety and avoidance. Cognitive-behavioral therapy for fear of blushing may help to reduce social anxiety in people with severe rosacea. Participants with extensive facial papules and pustules had higher blushing propensity, stress and social phobia scores than controls or those without papules or pustules. Cognitive-behavioral therapy appeared to be helpful for managing social anxiety in some individuals with rosacea with a fear of blushing.
Chodkiewicz et al, 2007 <sup>16</sup>	40 people with rosacea and 40 controls	Details not available	Patients with rosacea were less satisfied with their lives, subjectively felt that they receive poor social support, had difficulty in functioning in everyday life, worse general health perception, along with a higher level of anxiety and depression. Level of anxiety and depression and social integration were proved to be the predictors of life satisfaction.
Bohm et al, 2014 <sup>26</sup>	168 patients	- DLQI, - the rejection scale of the Questionnaire on Experience with Skin Complaints (QES) - HADS	Symptoms of anxiety and depression were indirectly linked with somatic symptoms, mediated through quality of life and stigmatization.
Egeberg et al, 2016 <sup>20</sup>	4,632,341 people	Nationwide registers	Mild and moderate-to-severe rosacea increased the risk of both depression and anxiety disorders.
Wu et al, 2017 <sup>23</sup>	201 rosacea patients, 196 controls	- HADS - DLQI	Patients with rosacea had significantly higher level of depression and anxiety. Quality of life impairment was significantly related to anxiety and depression scores.
